- ➤ **Data &Statistics:** Capture real live data from reports, manage, review and identify trends across the business.

- ➤ **Bespoke:** A bespoke service to help build, develop and implement your very own safety system, from an App to full system solution.

Risk Assessor Continued ... Key Points:

➢ The app and the system enable the user to create Method Statements and Risk Assessments – on site, if necessary - following a standard pre-set format.

➢ The system is freely available for a 30 day trial. There is an annual cost, unless the system is run on the user's server.

➢ The format can be changed and made bespoke to a client's requirements.

➢ The app can incorporate review reminders, external reports and photographs.

➢ The tool can also be run from the desktop.

➢ RAMS can be created "off-line" and then, when within a Wi-fi area, the information can be automatically sent to the client.

➢ One key advantage is that photographs can be taken of a situation and, with the use of the inbuilt library of hazard icons, each hazard can be swiftly identified. A full description of the hazard will be outlined within the main document.

➢ The system allows the user to produce an automatic RA and work out the severity of risk once the hazards have been populated. A password can be set to enable employees to view (but not edit) the data.

➢ The user is able to select, from a drop-down menu, the applicable legislation.

➢ The facility for voice activation can be added.

➢ Accident reporting is another feature within the system. Alerts can be set to immediately notify relevant personnel who are required to take action following an event.

➢ The client has control over what is stored and can remove information no longer required.

➢ There is a data limit per client and the choice is: 150mb – equivalent to 400-450 reports or 300mb (900 reports).

➢ Data is held securely across three sites, two of which are within the UK.
